

ABSTRACT

A communication system and method for using the system are disclosed. The communication system comprises a user equipment, an access network to which the user equipment is attachable and an access controller connected to the access network and a domain. The access controller is arranged to receive a query from the user equipment for a service provided by the domain, or a service accessible via the domain, to check if the user equipment is authorized. If so, the system permits the user equipment to obtain the service from or via the domain.
